

# Contextually Aware Risk Analysis of Sensors

# Contextually Aware Geopositioning Update

- Working on higher-fidelity theft detection.
- Changed monitoring period from 30 minutes to 5-10 minutes
- Issue for HMM,
  - Time-complexity increases significantly.
    - Risk Prediction is real-time
    - Training will need to be done when phone is not in use;
      - Do more general military sensors have such periods.
      - Move to cloud?
  - Lose predictability in data. ROC curves are much worse
  - Trying to impose initial structure in HMM to improve ROC curve.

# Contextually Aware Bluetooth Update

- Normalized Risk Metric so that it seemed to give reliable risk.
- Issue: We don't know if individuals felt at risk or not based on data. We are giving best estimates.

# SVM for global risk predictor.

- In implementation on phone, working on first run of data.
- No data yet

# LOOKING AT MALWARE SPREAD

- Infection Style: Parallel Vs. Serial
- Exposure Time - Viral Spread Speed
- Susceptibility - Different phone hardware/software
- Broadcast Radius - 802.11g vs. 802.11n

# LOOKING AT MALWARE SPREAD

## I. Realistic Mobility Model - UdelModels

- High Spatial Fidelity
- High Temporal Fidelity
- Accurate Population Density

Example UdelModels Simulation [UdelModel]

- [Channakeshava09] uses similar approach

# LOOKING AT MALWARE SPREAD

## 2. Target Geographical Area -- CHICAGO

[UdelModel]

Population  
9056  
[Landscan]

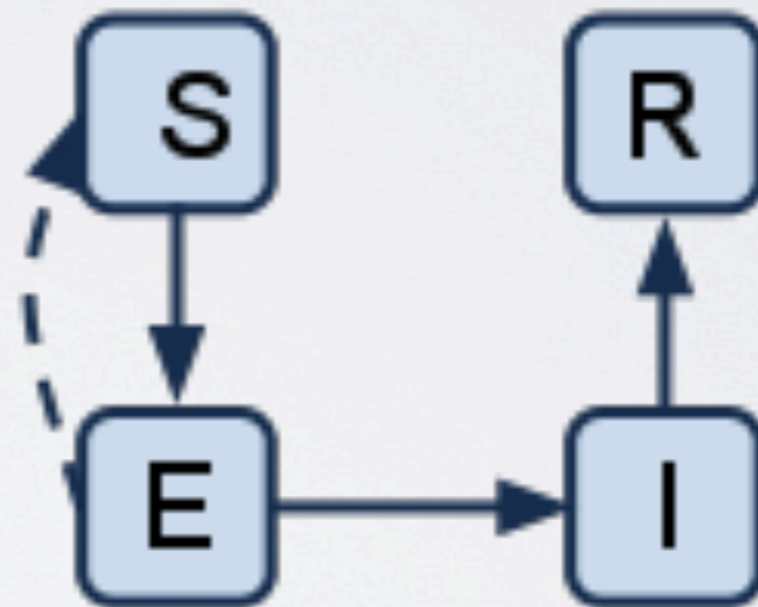

[USGSMap]

# LOOKING AT MALWARE SPREAD

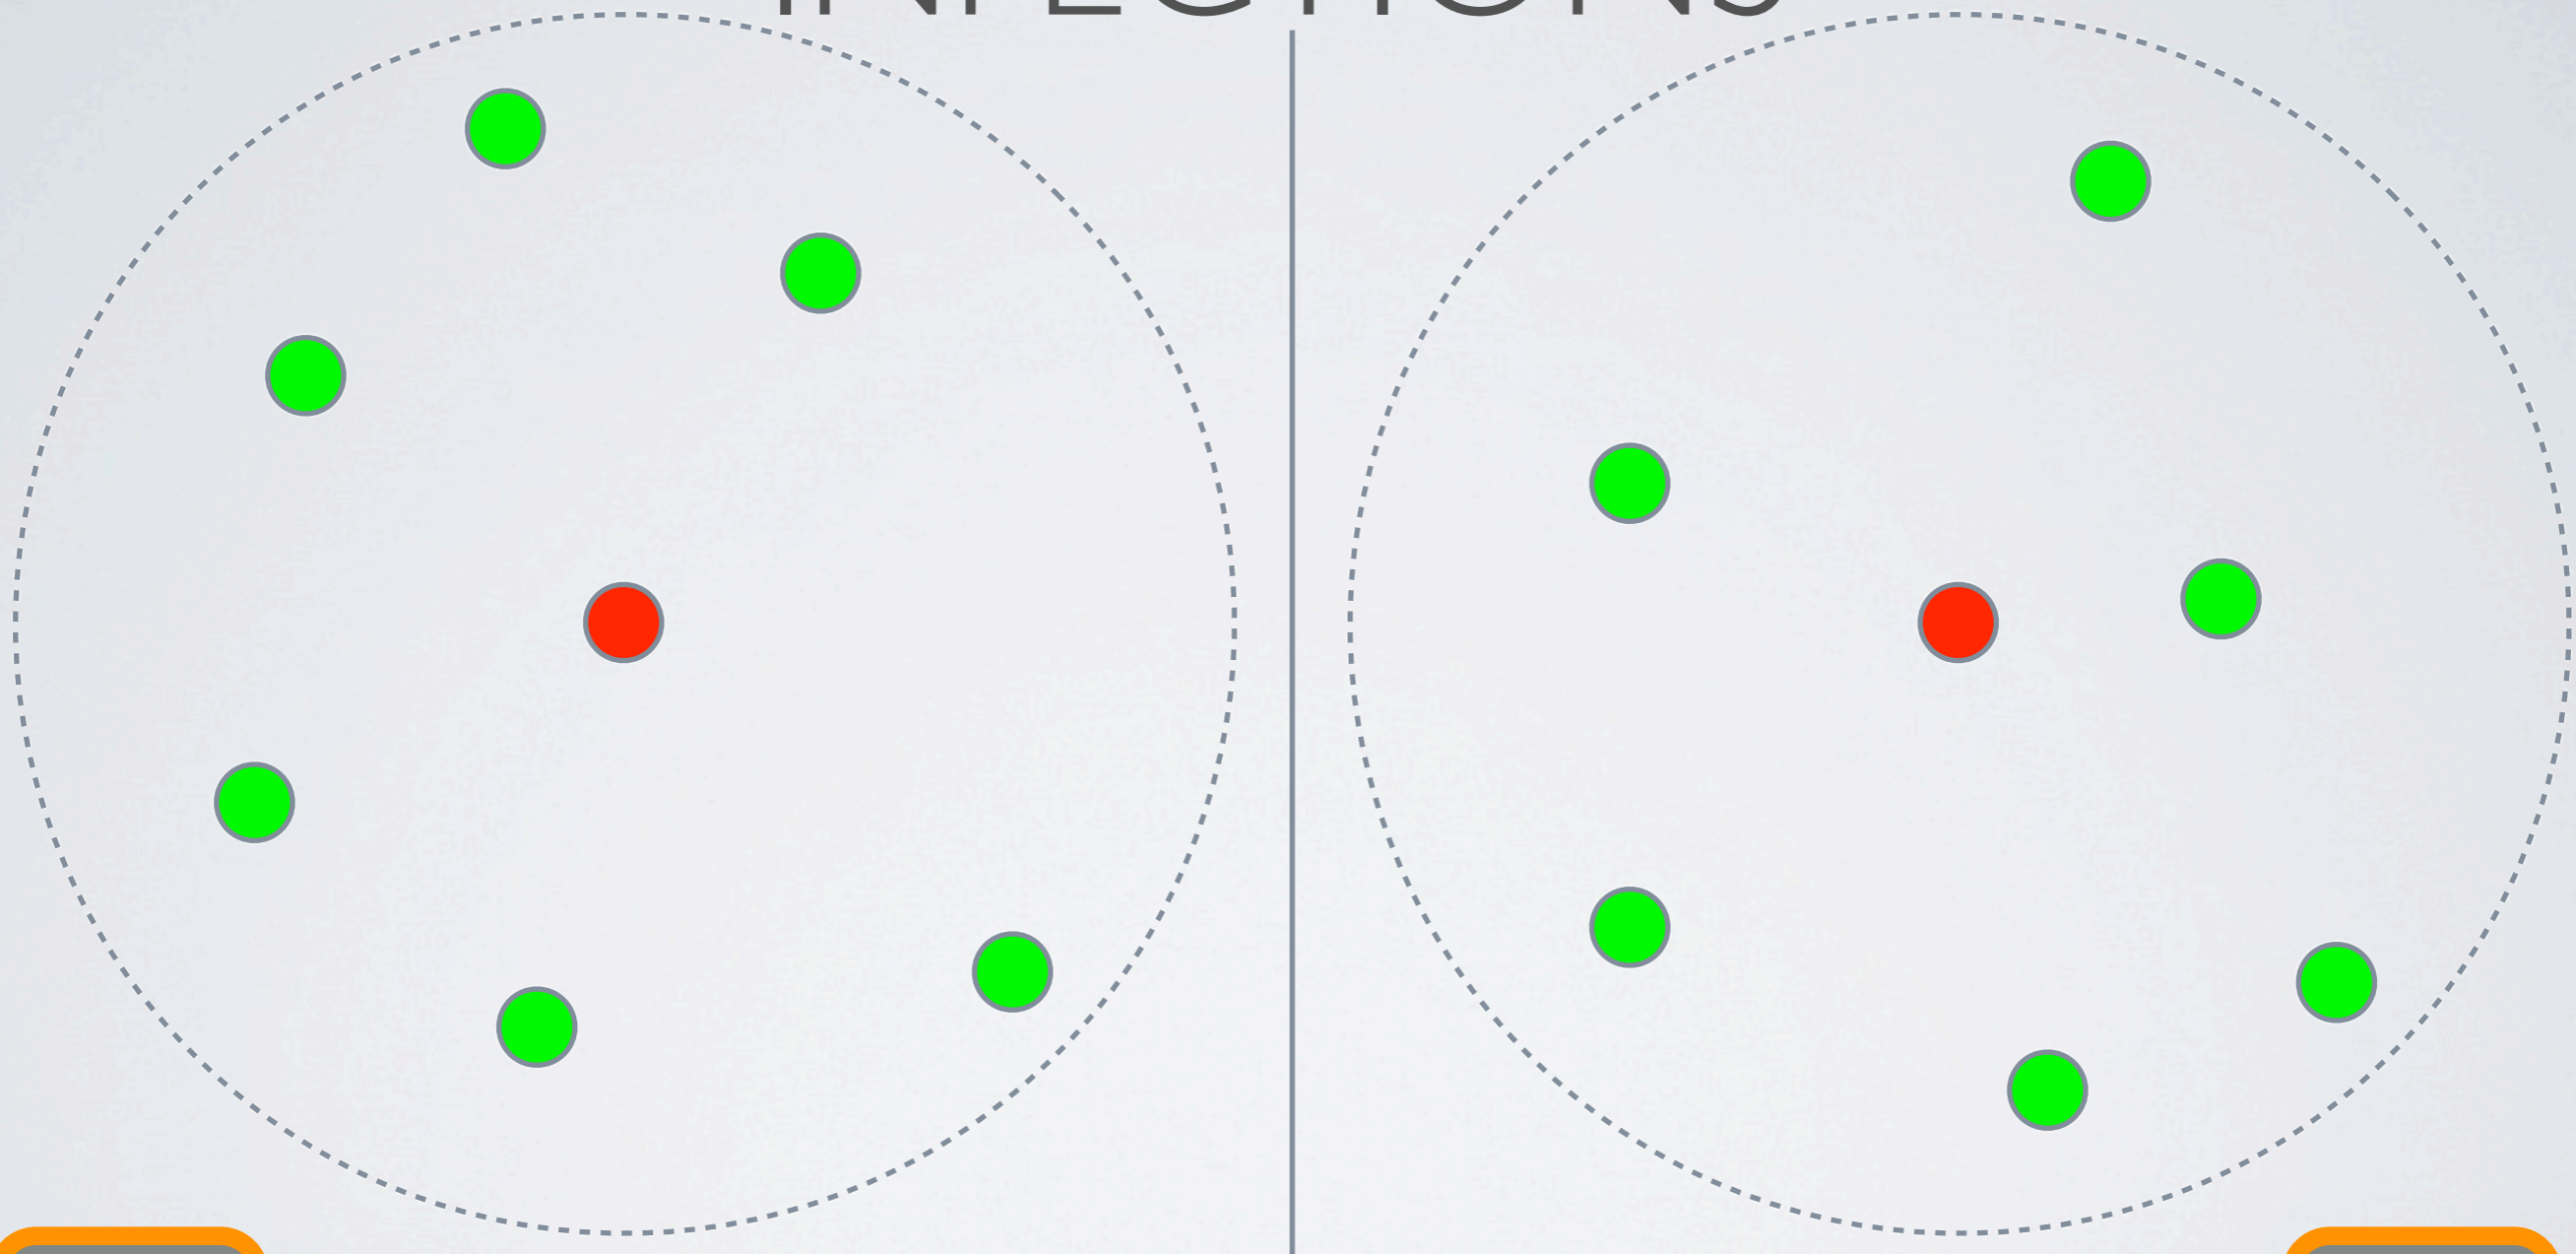

## 3. Epidemiological Model

- S-E-I-R Model
  - Susceptible
  - Exposed
  - Infected
  - Recovered

# SERIAL VS. PARALLEL INFECTIONS

**Dont  
Walk**

-  Not-Infected
-  Infected

**Dont  
Walk**

# EXPOSED POPULATIONS

● Not-Infected  
● Infected

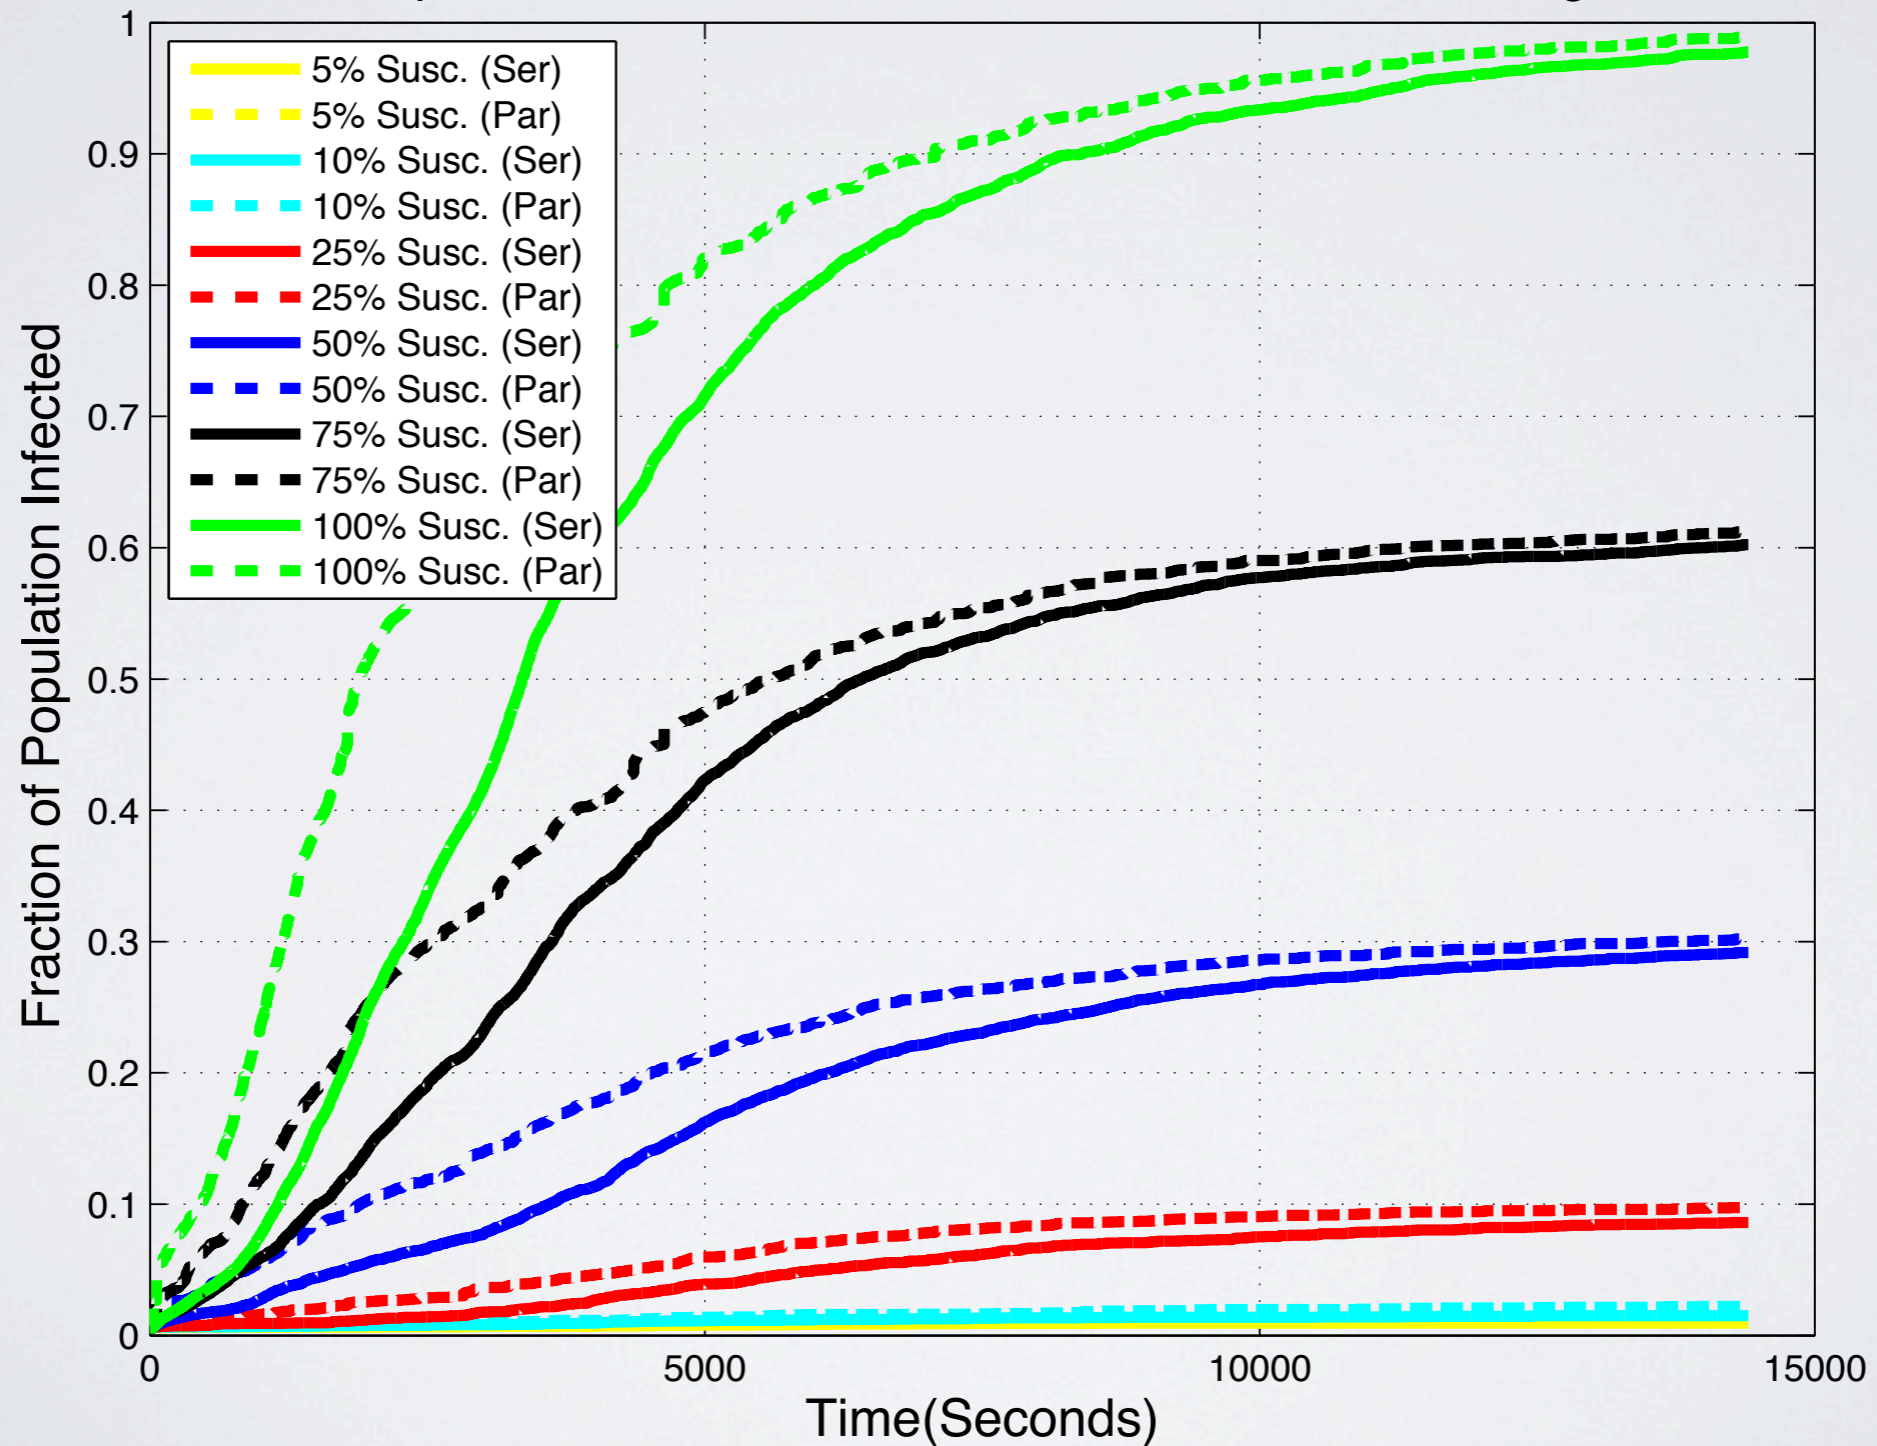

# EXPOSED POPULATIONS

Population Infections from 7:00AM – 11:00AM in Chicago

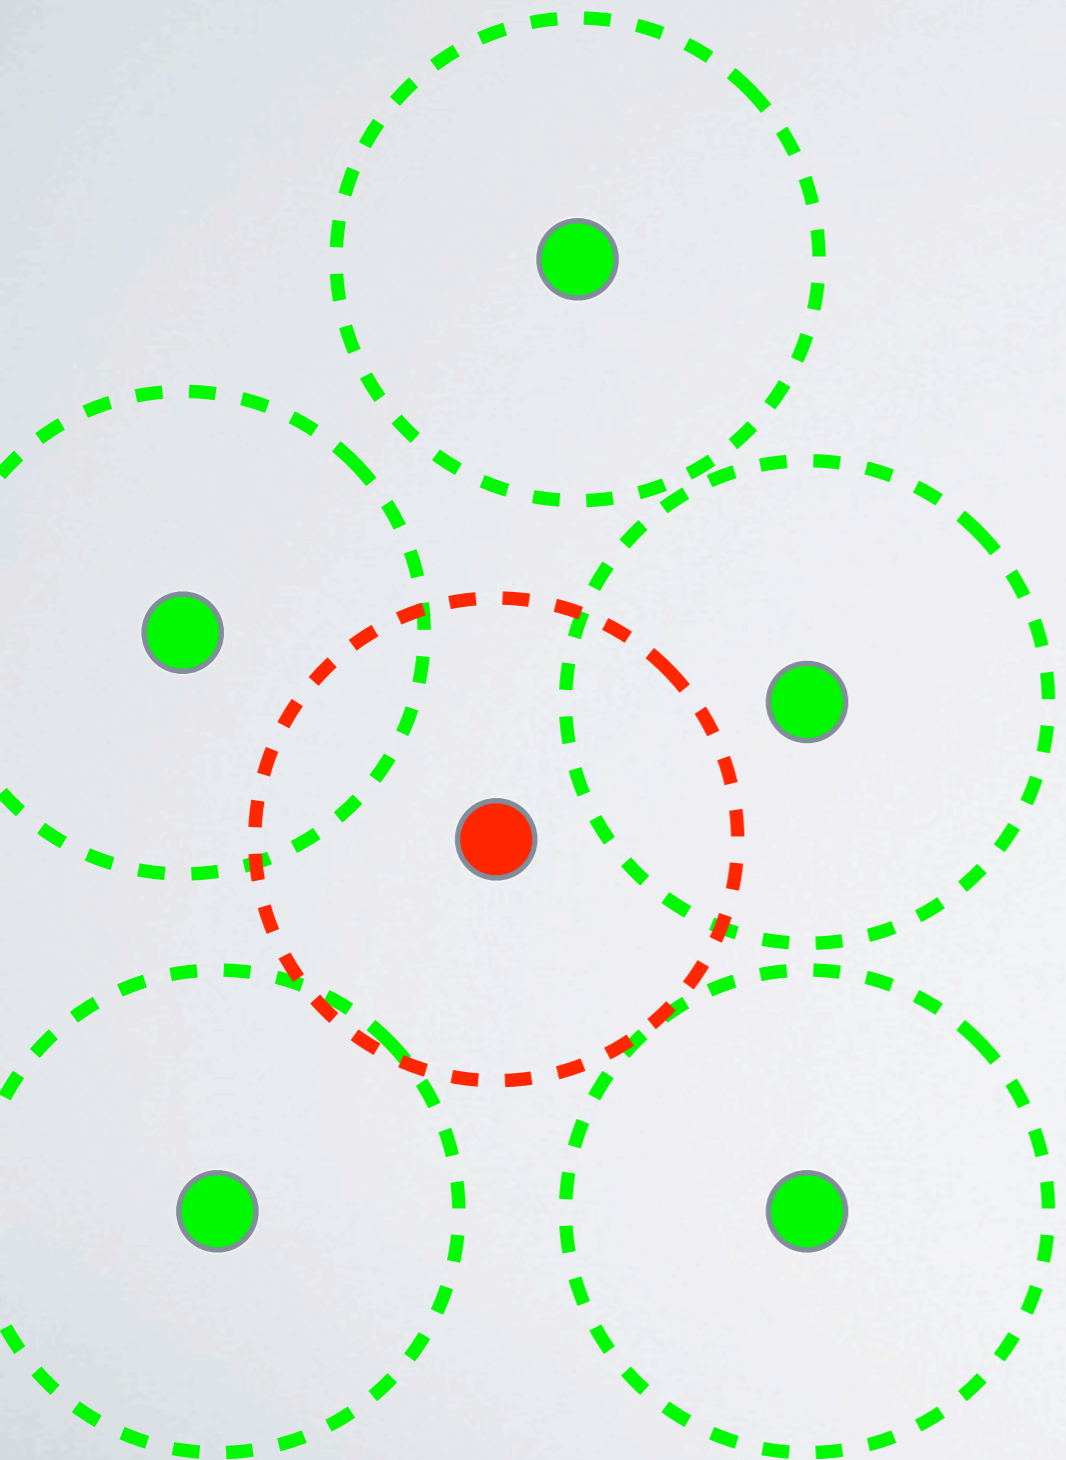

# SUSCEPTIBLE POPULATIONS

Population Infections at 7:00AM – 11:00AM in Chicago

# BROADCAST RADIUS INCREASE

-  Not-Infected
-  Infected

# BROADCAST RADIUS INCREASE

100% Susceptible

25% Susceptible
